

Invisi-Net Cutting/Hanging

When you receive the Opti-Net, it will resemble Figure A, (i.e. the meshes will be on a diamond shape). The reason it arrives this way is because the machine at the factory produces the netting at a diagonal angle. To hang it properly, the Opti-Net must be pulled at the corners to square the meshes, as in Figure B.

If you plan to cut your Opti-Net to accommodate your needs, you must first square the meshes and then cut between one single row of meshes from one side of the net to the other. Do not cut the net while the meshes are still in a diamond shape. It will take at least two people to cut the Opti-Net properly. One person needs to pull the netting tight, from both sides, to square the meshes, then the other person may cut it properly.
